SEVA_AI ABSTRACT REPORT

1) Organization

● **Team : 100x**

● **Domain: Digital Governance / Citizen Services (e-Governance)**

● **Target Stakeholders: Citizens, Government Officers, Department Administrators**

● **Deployment Scope: State/National service delivery (scheme access + applications + grievances).**

2) Problem Statement (Title)

SENATE BOT ADMINISTRATOR – SEVA AI – Autonomous Citizen Service Chatbot

3) Description

Citizens struggle with complex forms, multiple office visits, long queues, and unclear status tracking for basic government services. Existing chatbots are mostly FAQ-only and cannot complete services end-to-end. SENATE BOT provides a single conversational interface to apply for services, track status, retrieve verified scheme information, and file grievances, with human officer escalation for sensitive cases.

4) Abstract

SENATE BOT is a multilingual AI governance assistant that delivers:

● **Instant verified answers from government policy PDFs/circulars using RAG (document retrieval)**

● **Automatic language detection and seamless multilingual support**

● **End-to-end workflow support (apply → verify → submit → track)**

● **Human escalation with full conversation context transfer to officers**

● **Dashboards/analytics for monitoring queries, peak usage, and service gaps**

5) Idea / Approach

Step-by-step approach (how the system works):

1. Citizen interacts in chat/voice (Hindi/English/regional) with automatic language handling

2. Bot detects intent (apply service / track / grievance / info request)

3. If the user asks policy/scheme questions, bot uses RAG to read PDFs and reply with accurate answers

4. If it's a service request, bot runs a workflow:

○ **collects details & documents**

○ **validates eligibility + checklist**

○ **generates application/complaint ID**

○ **shows real-time status tracking**

5. For complex/sensitive cases, bot triggers auto-escalation to a government officer.

6. Admin dashboard provides analytics (top issues, peak times, content gaps) to improve governance delivery.

6) Business Model – Facts & Figures

Practical model (how it can be adopted)

● **Government deployment / department licensing (state/municipal departments)**

● **Per-department subscription (support + updates + analytics)**

● **Integration services (connecting portals, document repositories, WhatsApp/SMS)**

Facts & figures (from the abstract outcomes)

● **Similar chatbot automation showed ~30% reduction in administrative workload**

● Reported ~67% improvement in operational efficiency with automation and instant responses

Success KPIs (for pilots)

● 90%+ completion for straightforward flows (apply/track/grievance)

● <10 sec response for information queries

● Reduced office footfall and fewer repeated queries

● Escalation rate monitored (only complex cases go to officers)

7) Outcome

Prototype Deliverables (what you will show in hackathon)

● 3 end-to-end services (example):

1. Scheme application

2. Status tracking

3. Grievance filing + escalation

● Multilingual chat + basic voice mode

● RAG policy Q/A from government PDFs with citations

● Officer dashboard for escalated cases + context

● Transparency metrics dashboard (usage, common issues, response times)

Expected Impact

● Faster service access, less paperwork, reduced queues

● Better inclusion for rural/non-technical citizens

● Lower workload for officers, improved transparency & trust
